

1. 计算H电极的电势  $2H^+ + 2e^- = H_2$   $\varphi^0 = 0V$

$$\varphi(H^+/H_2) = \varphi^0 - \frac{RT}{nF} \ln \frac{P_{H_2}/P^0}{(C_{H^+}/C^0)^2}$$

$$= 0 - \frac{8.314 \times 298.15}{2 \times 96485} \ln \frac{10000/101325}{(0.2)^2} = -0.041V$$

2. 电极反应  $Cu_2O_2^{2-} + 14H^+ + 6e^- = 2Cu^+ + 7H_2O$   $\varphi^0 = 1.232V$

$$\varphi = \varphi^0 - \frac{RT}{6F} \ln \frac{(C_{Cu^+}/C^0)^2}{(\frac{C_{Cu_2O_2^{2-}}}{C^0}) (C_{H^+}/C^0)^{14}}$$

$$C_{Cu^+} = C_{Cu_2O_2^{2-}} = 1mol/L$$

$$= \varphi^0 + \frac{14RT}{6F} \ln H^+$$

$$pH=1 \quad C_{H^+} = 0.1mol/L \quad \varphi = 1.232 + \frac{14 \times 8.314 \times 298}{6 \times 96485} \ln 0.1 = 1.094V$$

$$pH=5 \quad C_{H^+} = 10^{-5}mol/L \quad \varphi = 1.232 + \frac{14 \times 8.314 \times 298}{6 \times 96485} \ln 10^{-5} = 0.542V$$

因此, 溶液酸性增强 即 pH 减小,  $Cu_2O_2^{2-}$  的氧化性增强。

3. 电极反应  $O_2 + 4H^+ + 4e^- = 2H_2O$   $\varphi^0(O_2/H_2O) = 1.229V$

$$\varphi = \varphi^0 - \frac{RT}{4F} \ln \frac{1}{(P_{O_2}/P^0) (C_{H^+}/C^0)^4}$$

$$\text{其中 } a_{H^+} = P^0$$

$$\varphi = \varphi^0 + \frac{RT}{F} \ln H^+$$

$$\varphi - \varphi^0 = \frac{RT}{F} \ln 10^{-1} = -\frac{RT}{F} \ln 10^{-3}$$

$$= -\frac{RT}{F} \ln (10^{-3}/10^{-3})$$

$$pH=1 \quad \varphi = \varphi^0 + \frac{RT}{F} \ln 10^{-1}$$

$$pH=3 \quad \varphi' = \varphi^0 + \frac{RT}{F} \ln 10^{-3}$$

$$= \frac{8.314 \times 298}{96485} \ln 100 = 0.118V$$

即 pH 从 1 增加到 3, 氧电极的电势下降 0.118V。

4. (1)  $Pt|H_2(100kPa)|HCl(0.1mol/L^+)|Cl_2(1atm)|Pt$   $\varphi_{Pt} = 0 - \frac{RT}{2F} \ln \frac{P_{H_2}/P^0}{(C_{H^+}/C^0)^2}$

$$= 0 - \frac{8.314 \times 298}{2 \times 96485} \ln \frac{10^5/101325}{(0.1/1)^2}$$

$$= -0.059V \quad (0.1/1)^2$$

$$\varphi_{Pt} = 1.3583 - \frac{RT}{2F} \ln \frac{(C_{Cl^-}/C^0)}{(P_{Cl_2}/P^0)}$$

$$= 1.3583 - \frac{8.314 \times 298}{2 \times 96485} \ln \frac{(0.1/1)}{10^5/101325}$$

$$H_2 + Cl_2 = 2H^+ + 2Cl^- \quad n=2$$

$$E = \varphi_{Pt} - \varphi_{Pt} = 1.417 - (-0.059)$$

$$= 1.476V$$

电极电势  $\phi_{\text{正}} = -0.15224 - \frac{RT}{F} \ln(\frac{\text{I}^-}{\text{I}^\circ})$   
 $= -0.15224 - \frac{8.314 \times 298}{96485} \ln 0.1 = -0.093\text{V}$

$\phi_{\text{负}} = +0.07133\text{V} - \frac{RT}{F} \ln(\frac{\text{Br}^-}{\text{Br}^\circ})$

$= 0.07133\text{V} - \frac{8.314 \times 298}{96485} \ln 0.1 = 0.130\text{V}$

电动势  $E = \phi_{\text{正}} - \phi_{\text{负}} = 0.130 - (-0.093) = 0.223\text{V}$

5. 求  $\text{Hg}_2\text{Cl}_2(\text{s})$  的  $K_{\text{sp}}$

设计电池

电池反应就是所求的离子反应 其中  $n=2$

$\ln K^\circ = \frac{nE^\circ}{RT} = \frac{2 \times 96485}{8.314 \times 298} (\phi^\circ_{\text{正}} - \phi^\circ_{\text{负}})$

$= \frac{2 \times 96485}{8.314 \times 298} \times (-0.52) = -40.5$

$K^\circ = 2.58 \times 10^{-18}$

6. 铜锌无电池

$E = E^\circ - \frac{RT}{2F} \ln \frac{(\text{Cu}^{2+}/\text{Cu})}{(\text{Zn}^{2+}/\text{Zn})}$

即  $1.10 = 1.1037 - \frac{8.314 \times 298.15}{2 \times 96485} \ln \frac{(\text{Zn}^{2+}/\text{Cu})}{0.02}$

得  $\text{Cu}^{2+} = 0.0267 \text{ mol/L}$

7. 电池反应  $\text{Fe}^{3+} + \text{Ag}(s) = \text{Fe}^{2+} + \text{Ag}^+$   $n=1$

正极  $\text{Ag}(s) - e^- = \text{Ag}^+$   $\varphi_{\text{Ag}}^0 = 0.7996 \text{ V}$

负极  $\text{Fe}^{3+} + e^- = \text{Fe}^{2+}$   $\varphi_{\text{Fe}}^0 = 0.771 \text{ V}$

$$E^0 = \varphi_{\text{Ag}}^0 - \varphi_{\text{Fe}}^0 = 0.771 - 0.7996 = -0.0286 \text{ V}$$

$$\ln K^0 = \frac{nFE^0}{RT} = \frac{96485 \times (-0.0286)}{8.314 \times 298} = -1.114$$

$$K = 0.328$$

8. 根据  $\varphi$  的大小比较氧化还原能力强弱

$\text{Fe}^{2+}$  能被  $\text{O}_2$  氧化为  $\text{Fe}^{3+}$

$\text{Co}^{2+}$  不能被  $\text{O}_2$  氧化为  $\text{Co}^{3+}$

9. 化学反应  $\text{Fe} + 2\text{Fe}^{3+} = 3\text{Fe}^{2+}$

电极反应

正极  $\text{Fe} - 2e^- = \text{Fe}^{2+}$   $\varphi_{\text{Fe}}^0 = -0.44 \text{ V}$

负极  $2\text{Fe}^{3+} + 2e^- = 2\text{Fe}^{2+}$   $\varphi_{\text{Fe}}^0 = 0.77 \text{ V}$

$$E^0 = \varphi_{\text{Fe}}^0 - \varphi_{\text{Fe}}^0 = 0.77 - (-0.44) = 1.22 \text{ V} \quad n=2$$

$$\ln K^0 = \frac{nE^0F}{RT} = \frac{2 \times 1.22 \times 96485}{8.314 \times 298} = 95.02$$

$$K = 1.85 \times 10^{41}$$

10. 反应  $\text{Sn} + \text{Pb}^{2+} \rightleftharpoons \text{Sn}^{2+} + \text{Pb}$

$$E^0 = \varphi(\text{Pb}^{2+}/\text{Pb}) - \varphi(\text{Sn}^{2+}/\text{Sn}) = -0.1262 - (-0.1375) = 0.0113 \text{ V}$$

$$K^0 = e^{\frac{nE^0F}{RT}} = e^{\frac{2 \times 0.0113 \times 96485}{8.314 \times 298}} = 2.41 = \left[ \frac{c_{\text{Sn}^{2+}}/c^0}{c_{\text{Pb}^{2+}}/c^0} \right] e$$

$$J = \frac{c_{\text{Sn}^{2+}}/c^0}{c_{\text{Pb}^{2+}}/c^0} = \frac{1 \text{ mol/L}}{0.1 \text{ mol/L}} = 10 > K = 2.41$$

∴ 反应向生成  $\text{Pb}^{2+}$  方向移动, 即 不会自发进行。

Date

$$\varphi^\circ \text{ of } \text{Pt}, \text{O}_2(\text{H}_2\text{O}) = 1.229 \text{ V}$$

$$\varphi = \varphi^\circ - \frac{RT}{nF} \ln \left[ \frac{(\text{B反去})}{(\text{A反去})} \right]$$

已知 298K 反电池的电动势  $E = 0.010 \text{ V}$

11. 反电池构成

为浓差电池

(1) 电极反应

(2) 电池反应

(3) 电动势

$$E = E^\circ - \frac{RT}{nF} \ln \frac{(\text{CH}^+/\text{cc})^4}{(\text{CH}^+(\text{cc})/\text{cc})^4}$$

$$E^\circ = \varphi^\circ(\text{阳}) - \varphi^\circ(\text{阴}) = 0$$

$$E = 0.01 \text{ V}$$

$$n = 4$$

$$\text{CH}^+ = 0.1 \text{ mol/L}$$

$$T = 298 \text{ K}$$

$$\Rightarrow \boxed{\text{CH}^+(\text{cc}) = 0.148 \text{ mol/L}}$$

$$\begin{aligned} \varphi_{\text{阳}} &= \varphi(\text{O}_2/\text{H}^+) \\ &= \varphi^\circ - \frac{RT}{4F} \ln \left[ \frac{(\text{CH}^+/\text{cc})^4}{(\text{PO}_2)} \right] \end{aligned}$$

$$\begin{aligned} \varphi_{\text{阴}} &= \varphi(\text{H}^+/\text{O}_2) \\ &= \varphi^\circ - \frac{RT}{4F} \ln \left[ \frac{(\text{CH}^+(\text{cc}))^4}{\text{cc}} \cdot \frac{\text{PO}_2}{\text{PO}_2^\circ} \right] \end{aligned}$$

$$E = \varphi_{\text{阴}} - \varphi_{\text{阳}}$$

$$= -\frac{RT}{4F} \left[ \ln \frac{1}{(\text{CH}^+(\text{cc})/\text{cc})^4} - \ln \frac{1}{(\text{CH}^+/\text{cc})^4} \right]$$

$$\text{即 } 0.010 = \frac{-8.314 \times 298}{4 \times 96485} \ln \left( \frac{\text{CH}^+(\text{cc})}{\text{CH}^+} \right)^{-4}$$

$$\text{即 } \ln \frac{\text{CH}^+(\text{cc})}{\text{CH}^+} = 0.389$$

$$\frac{\text{CH}^+(\text{cc})}{0.1 \text{ mol/L}} = 1.48$$

$$\therefore \text{CH}^+(\text{cc}) = 0.148 \text{ mol/L}$$

#### ④ 判断最强的氧化剂和最强的还原剂 原则

$\phi$  越大, 易发生还原反应,

该电极的氧化态物质易得电子, 强氧化剂

$\phi$  越小, 易... 氧化反应

该... 还原态... 失... 强还原剂

$\phi^\ominus$

(1)  $\text{Fe}^{3+}/\text{Fe}^{2+}$  +0.771 V

$\text{I}_2/\text{I}^-$  +0.5355 V

$\text{Fe}^{2+}/\text{Fe}$  -0.447 V

i.  $\text{Fe}^{3+}$  最强氧化剂  $\text{Fe}$  最强还原剂

$\phi^\ominus$

(2)  $\text{MnO}_4^-/\text{Mn}^{2+}$  +1.507 V

$\text{Cl}_2/\text{Cl}^-$  +1.35827 V

$\text{H}_2\text{O}_2/\text{H}_2\text{O}$  +1.776 V

i.  $\text{H}_2\text{O}_2$  最强氧化剂

$\text{Cl}^-$  最强还原剂

13. pH计  $E = k - \frac{2.303RT}{F} \text{pH}$

pH=10  $E = k - \frac{2.303RT}{F} \times 10$

pH=8  $E' = k - \frac{2.303RT}{F} \times 8$

$\therefore \Delta E = E' - E = \frac{-2.303RT}{F} \times (8-10) = 0.118 \text{ V}$

$\Delta_f G_m^\ominus$  -33 0 0 -237.19

$\Delta_r G_m^\ominus = +3 \times (-237.19) - (-33) = -708.27 \text{ kJ}\cdot\text{mol}^{-1}$

$\varphi^\ominus = E = -\frac{\Delta_r G_m^\ominus}{nF} = \frac{708.27 \times 10^3}{5 \times 96485} = -1.47 \text{ V}$

$\varphi^\ominus(\text{Sn}^{4+}/\text{Sn}^{2+}) = 0.151 \text{ V}$

該反應中  $\text{Sn}^{2+}$  被氧化,  $\varphi(\text{Sn}^{2+}/\text{Sn}^{4+})$  為負極

$E^\ominus = \varphi_{\text{陽}}^\ominus - \varphi_{\text{陰}}^\ominus = 0.771 \text{ V} - 0.151 \text{ V} = 0.62 \text{ V}$

(1) 所有離子濃度均為  $1 \text{ mol/L}$   $E^\ominus > 0$  即  $\Delta G^\ominus < 0$  反應正向進行

(2)  $E = E^\ominus - \frac{RT}{nF} \ln \frac{1 \times 1}{0.01 \times 0.01} = 0.62 - \frac{8.314 \times 298}{2 \times 96485} \ln 10^4$

$= 0.502 \text{ V}$

$E > 0$ ,  $\Delta G < 0$ , 反應正向進行。即  $\text{Sn}^{2+}$  會被氧化成  $\text{Sn}^{4+}$ 。

$\varphi_{\text{陰}}^\ominus = -0.126 \text{ V}$

電極反應:

$\varphi_{\text{陽}}^\ominus = -0.359 \text{ V}$

$E^\ominus = \varphi_{\text{陽}}^\ominus - \varphi_{\text{陰}}^\ominus = -0.359 - (-0.126) = -0.233 \text{ V}$

$K_{\text{sp}} = K = e^{\frac{nEF}{RT}} = e^{-2 \times 0.233 \times 96485 / (8.314 \times 298)} = 1.3 \times 10^{-8}$

即電動勢或電池電勢為 0.118 V

设计电池反应

$$E^\ominus = \varphi_{\text{Mn}}^\ominus - \varphi_{\text{Ag}}^\ominus = 1.23 - 1.36\text{V} = -0.13\text{V}$$

$$E = E^\ominus - \frac{RT}{2F} \ln \frac{(P_{\text{Cl}_2}/p^\ominus) (C_{\text{Mn}^{2+}}/c^\ominus)}{(C_{\text{H}^+}/c^\ominus)^4 (C_{\text{Cl}^-}/c^\ominus)^2}$$

$$= -0.13 - \frac{8.314 \times 298}{2 \times 96485} \ln \frac{10^5}{(0.01)^4 \times (0.2)^2} \times 0.2$$

$$= -0.13 - 0.256 = -0.39\text{V} < 0$$

$\therefore$  反应不能自发进行。

12. 解：析 Ag 难以置换  $1\text{mol L}^{-1}$   $\text{HCl}$  中  $\text{Ag}^+$ 。

即  $\text{Ag}^+$  置换  $1\text{mol L}^{-1}$   $\text{HI}$  中  $\text{I}_2$ 。

$$E = 0 - (-0.15224) = 0.15224 > 0$$

$\therefore \Delta G < 0$  反应可以自发进行。  $\Delta G^\ominus = -nFE^\ominus$

$$E = 0 - (+0.22233) < 0 \quad \therefore \Delta G > 0$$

反应不能自发进行。
